

Effective Programming Practices for Economists

Reproducible Research

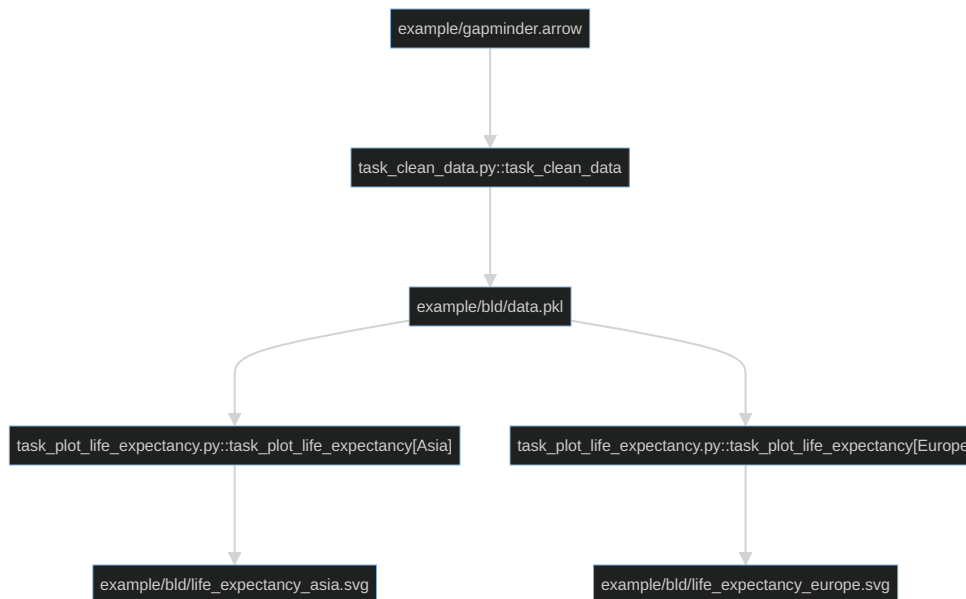

Re-using pytask functions

Janoś Gabler and Hans-Martin von Gaudecker

1 tasks, 2 products

2 tasks, 1 product each

Contents of task_plot_life_expectancy.py

```
BLD = Path(__file__).parent / "bld"

products = {
    "Asia": BLD / "life_expectancy_asia.svg",
    "Europe": BLD / "life_expectancy_europe.svg"
}

def task_plot_life_expectancy(
    data_file=BLD / "data.pkl",
    produces=products,
):
    df = pd.read_pickle(data_file)
    for region, fig_file in produces.items():
        fig = _plot_life_expectancy(df[df["continent"] == region])
        fig.write_image(fig_file)
```

Contents of task_plot_life_expectancy.py

```
from pytask import task

BLD = Path(__file__).parent / "bld"

for region in ("Asia", "Europe"):

    @task(id=region)
    def task_plot_life_expectancy(
        data_file=BLD / "data.pkl",
        produces=BLD / f"life_expectancy_{region.lower()}.svg",
        region=region,
    ):
        df = pd.read_pickle(data_file)
        fig = _plot_life_expectancy(df[df["continent"] == region])
        fig.write_image(produces)
```

Verify Dependency graph (DAG, tree)

- Inspect function signatures to build a dependency graph
- Tasks for each region appear
- Additional dependency: ``region`` variable (ignore for now)

Run pytask

A terminal window with a dark background. The title bar shows the user 'hmg' at 'hmg-home' in the directory '~/econ/example'. The prompt is '(epp)'. The user has entered '→ example pytask'. The output shows the start of a pytask session, platform and version information, and a list of three tasks. A table shows the tasks and their outcomes, all marked with green dots. A summary box shows 3 tasks collected and 3 succeeded (100.0%). The session ended with 'Succeeded in 1.02 seconds'. The prompt is now '(epp) → example' followed by a cursor.

```
hmg@hmg-home:~/econ/example

(epp) → example pytask
────────── Start pytask session ─────────
Platform: linux -- Python 3.11.0, pytask 0.4.0rc3, pluggy 1.3.0
Root: /mnt/econ/example
Collected 3 tasks.

| Task                                                            | Outcome |
|-----------------------------------------------------------------|---------|
| task_clean_data.py::task_clean_data                             | •       |
| task_plot_life_expectancy.py::task_plot_life_expectancy[Asia]   | •       |
| task_plot_life_expectancy.py::task_plot_life_expectancy[Europe] | •       |

Summary

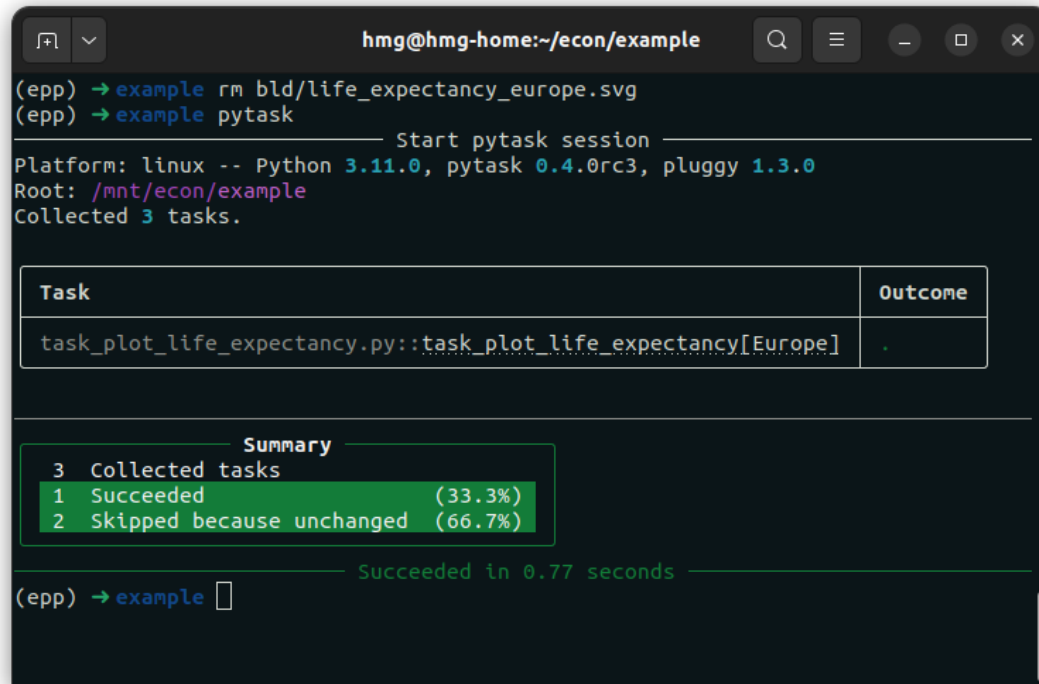

3 Collected tasks  

3 Succeeded (100.0%)

────────── Succeeded in 1.02 seconds ─────────
(epp) → example
```

Delete plot and run again

```
hmg@hmg-home:~/econ/example
(epp) → example rm bld/life_expectancy_europe.svg
(epp) → example pytask

----- Start pytask session -----
Platform: linux -- Python 3.11.0, pytask 0.4.0rc3, pluggy 1.3.0
Root: /mnt/econ/example
Collected 3 tasks.

| Task                                                            | Outcome |
|-----------------------------------------------------------------|---------|
| task_plot_life_expectancy.py::task_plot_life_expectancy[Europe] | .       |

----- Summary -----
3 Collected tasks
1 Succeeded (33.3%)
2 Skipped because unchanged (66.7%)

----- Succeeded in 0.77 seconds -----
(epp) → example
```

Looping over tasks

- Define your function as usual, but within a loop body
- Set an id based on the running variable(s) via `@task(id=running_var)`
- Set path arguments based on running variable
- Could pass other Python objects, like running variable itself

Looping over tasks or over products?

- Whatever makes your project structure clearer!
- Same style of graphs based on the same dataset: Probably loop over products
- Model specifications: Loop over tasks
- Long running tasks: Loop over tasks
- Looping over tasks yields more granular structure
