

# Effective Programming Practices for Economists

## Basic Python

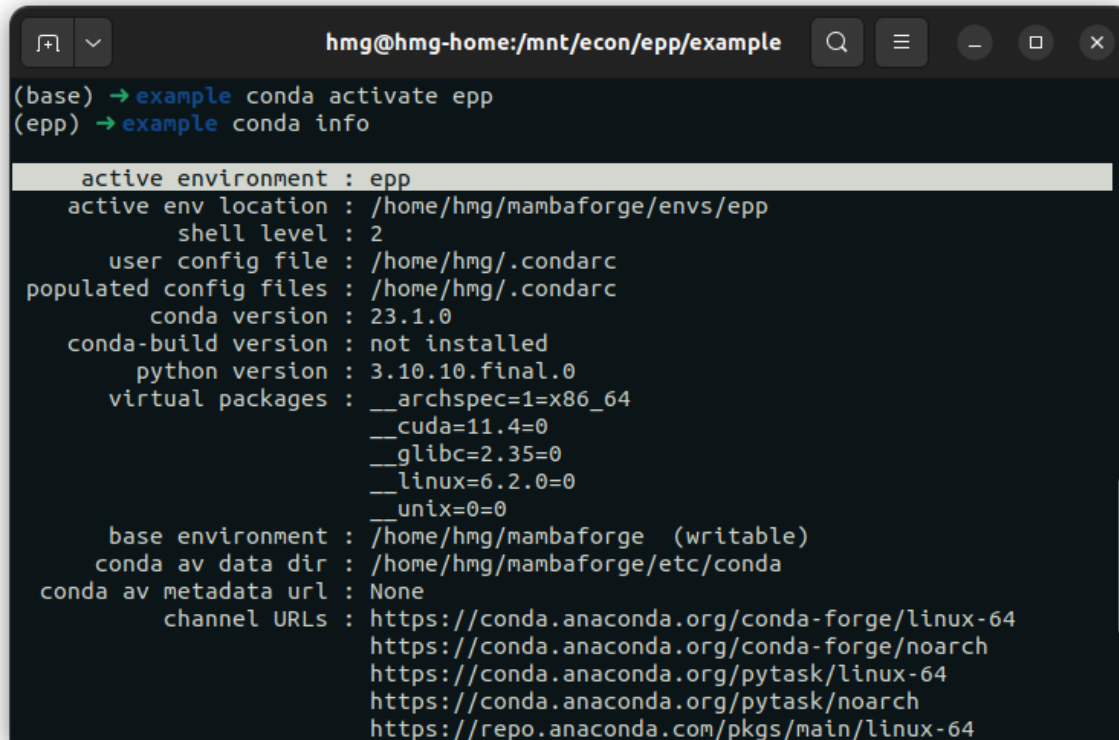

### Running Python code via pytask

Janoś Gabler and Hans-Martin von Gaudecker

# Preparation

- We assume you have installed anaconda and created the course environment
- Open a shell in the root directory of your project
  - On Windows, use the anaconda prompt or the powershell
  - If conda is not recognized in the powershell, check out this [stackoverflow post](#)
- Activate the environment using ``conda activate epp``
- Confirm the activation worked using ``conda info``

# 0: Activate and Info

```
hmg@hmg-home:/mnt/econ/epp/example
(base) → example conda activate epp
(epp) → example conda info

active environment : epp
active env location : /home/hmg/mambaforge/envs/epp
shell level : 2
user config file : /home/hmg/.condarc
populated config files : /home/hmg/.condarc
conda version : 23.1.0
conda-build version : not installed
python version : 3.10.10.final.0
virtual packages : __archspec=1=x86_64
                  __cuda=11.4=0
                  __glibc=2.35=0
                  __linux=6.2.0=0
                  __unix=0=0
base environment : /home/hmg/mambaforge (writable)
conda av data dir : /home/hmg/mambaforge/etc/conda
conda av metadata url : None
channel URLs : https://conda.anaconda.org/conda-forge/linux-64

              https://conda.anaconda.org/pytask/noarch
              https://repo.anaconda.com/pkg/main/linux-64
```

# How does pytask execute code?

- Executing .py files: Run the entire file
- Executing notebooks: Run individual cells
- Pytask: Run individual functions in multiple .py files

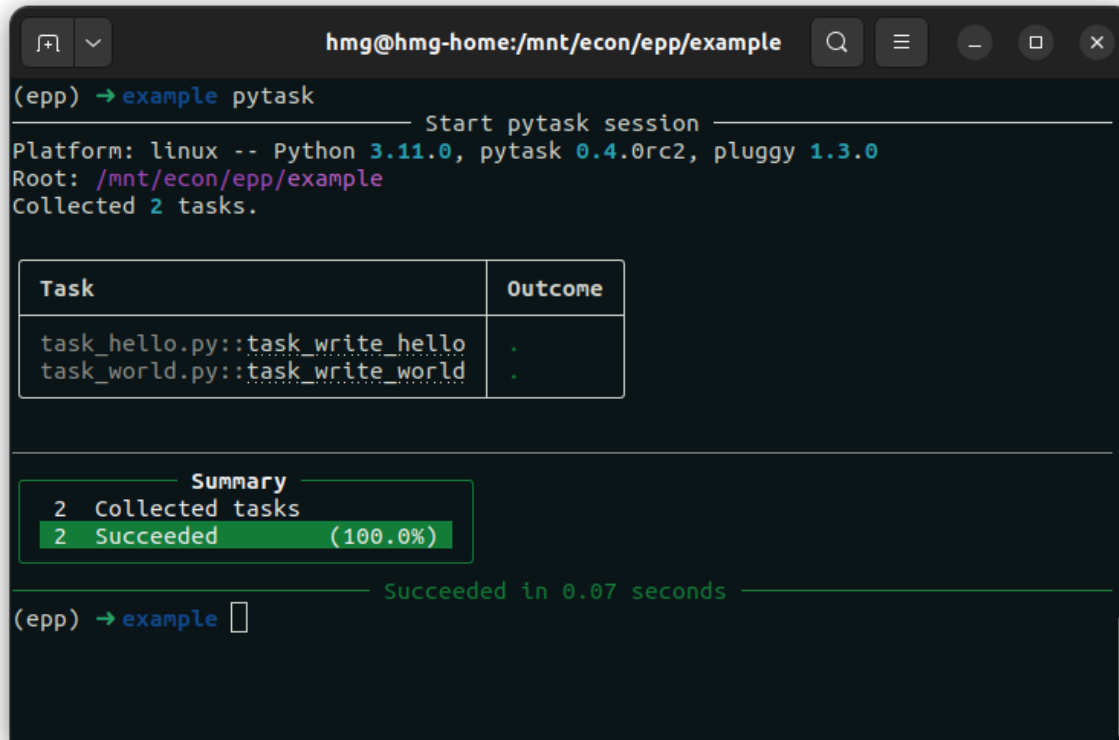

Very useful for automating research pipelines

# Example Project Structure

- Our shell is in the `example` directory
- We want to run all functions that start with `task_` in both `.py` files
- Command is `pytask`

# 1: Execute

```
hmg@hmg-home:/mnt/econ/epp/example
(epp) → example pytask

Start pytask session
Platform: linux -- Python 3.11.0, pytask 0.4.0rc2, pluggy 1.3.0
Root: /mnt/econ/epp/example
Collected 2 tasks.

| Task                            | Outcome |
|---------------------------------|---------|
| task_hello.py::task_write_hello | .       |
| task_world.py::task_write_world | .       |

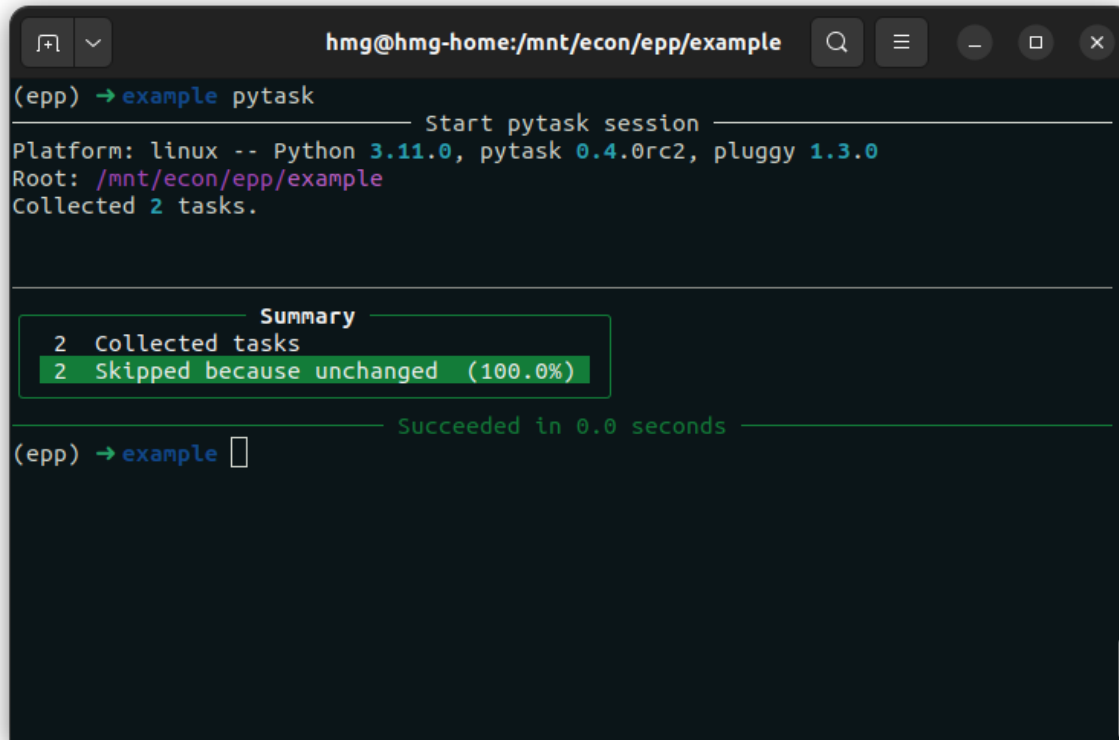

Summary
2 Collected tasks
2 Succeeded (100.0%)

Succeeded in 0.07 seconds
(epp) → example
```

The terminal window displays the execution of a pytask session. It shows the platform (linux), Python version (3.11.0), pytask version (0.4.0rc2), and pluggy version (1.3.0). The root directory is /mnt/econ/epp/example, and 2 tasks were collected. A table shows the tasks and their outcomes: task\_hello.py::task\_write\_hello and task\_world.py::task\_write\_world, both succeeded. A summary box indicates 2 collected tasks, 2 succeeded (100.0%). The session succeeded in 0.07 seconds.

# 1: Execute again

```
hmg@hmg-home:/mnt/econ/epp/example
(epp) → example pytask
Start pytask session
Platform: linux -- Python 3.11.0, pytask 0.4.0rc2, pluggy 1.3.0
Root: /mnt/econ/epp/example
Collected 2 tasks.

Summary
2 Collected tasks
2 Skipped because unchanged (100.0%)

Succeeded in 0.0 seconds
(epp) → example
```

The terminal window shows the execution of the 'pytask' command. It displays the platform (linux), Python version (3.11.0), pytask version (0.4.0rc2), and pluggy version (1.3.0). It also shows the root directory (/mnt/econ/epp/example) and that 2 tasks were collected. A summary box highlights that 2 tasks were collected and 2 tasks were skipped because they were unchanged (100.0%). The execution succeeded in 0.0 seconds.
