Reproducible Research

Writing (py)tasks with multiple outputs

Janoś Gabler and Hans-Martin von Gaudecker

Tiny example, extended

- How do we tell pytask that we have two products for `task_plot_life_expectancy`?
- How would we tell pytask that we had more than one dependency?

Contents of task_clean_data.py

```
from pathlib import Path
```

```
import pandas as pd
```

```
BLD = Path(__file__).parent / "bld"
```

```
def task_clean_data(raw_file=Path("gapminder.arrow"), produces=BLD / "data.pkl"):  
    raw = pd.read_feather(raw_file)  
    clean = _clean_data(raw)  
    clean.to_pickle(produces)
```

```
def _clean_data(raw):  
    df = raw.rename(  
        columns={  
            "lifeExp": "life_exp",  
            "gdpPercap": "gdp_per_cap",  
        },
```

Contents of task_plot_life_expectancy.py

```
BLD = Path(__file__).parent / "bld"

products = {
    "Asia": BLD / "life_expectancy_asia.svg",
    "Europe": BLD / "life_expectancy_europe.svg"
}

def task_plot_life_expectancy(
    data_file=BLD / "data.pkl",
    produces=products,
):
    df = pd.read_pickle(data_file)
    for region, fig_file in produces.items():
        fig = _plot_life_expectancy(df[df["continent"] == region])
        fig.write_image(fig_file)
```

Multiple dependencies and products

- Defaults to keyword arguments may hold
 - a single `pathlib.Path`
 - a container of `pathlib.Path` objects
 - Container may be nested, so long as the atomic elements are `pathlib.Path` objects
- For dependencies, can pass as many different arguments with defaults as you like
