

Effective Programming Practices for Economists

Basic Python

Running Python code via pytest

Janoś Gabler, Hans-Martin von Gaudecker, and Tim Mensinger

Preparation

We assume you have:

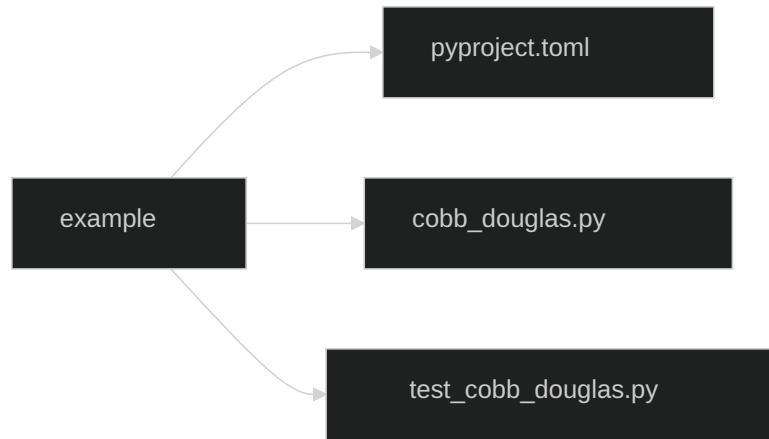

- Installed pixi
- Navigated to the root directory of your project in a shell
- The root directory of your contains a `pyproject.toml` file that includes pytest and at least one file expected by pytest

How does pytest execute code?

- Executing .py files: Run the entire file
- Executing notebooks: Run individual cells
- Pytest: Run individual functions in multiple .py files

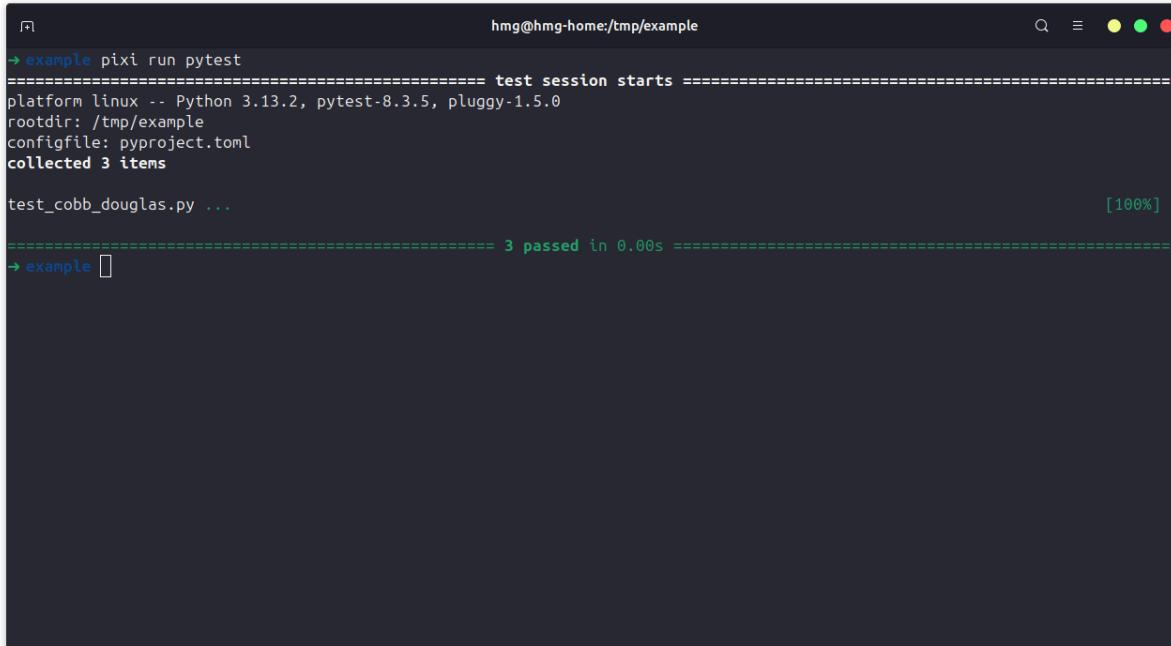

Very useful for automating test execution across an entire project

Example Project Structure

- Our shell is in the `example` directory
- We want to run all functions that start with `test_` in `test_cobb_douglas.py`
- Could be spread across multiple test files, across different subdirectories
- Command is `pytest`

Execute

A screenshot of a terminal window titled "hmg@hmg-home:/tmp/example". The window shows the output of a pytest run. The command entered was "example pixi run pytest". The terminal displays the following text:

```
→ example pixi run pytest
=====
platform linux -- Python 3.13.2, pytest-8.3.5, pluggy-1.5.0
rootdir: /tmp/example
configfile: pyproject.toml
collected 3 items

test_cobb_douglas.py ...
[100%]
