### **Effective Programming Practices for Economists**

# Software engineering

Writing simple (py)tests

Janoś Gabler and Hans-Martin von Gaudecker

## Reminder of the example

```
>>> raw = pd.read_csv("survey.csv")
>>> raw
```

0004	0000	0000
Q001	Q002	Q003
0 strongly disagree	agree	python
1 strongly agree	strongly agree	Python
<b>2</b> -77	disagree	R
3 agree	-77	Python
4 -99	-99	Python
5 NaN	strongly agree	Python
6 neutral	strongly agree	Python
7 disagree	agree	python
8 strongly agree	-99	PYTHON
9 agree	-99	Ypthon

#### From the metadata you know

- Q001: I am a coding genius
- Q001: I learned a lot
- Q003: What is your favourite language
- -77 not readable
- -99 no reply

## First function in clean\_data.py

```
def _clean_agreement_scale(sr):
    sr = sr.replace({"-77": pd.NA, "-99": pd.NA})
    categories = ["strongly disagree", "disagree", "neutral", "agree", "strongly agree"]
    dtype = pd.CategoricalDtype(categories=categories, ordered=True)
    return sr.astype(dtype)
```

## A function in test\_clean\_data.py

#### Function's properties:

- starts with `test\_`
- name explains what it does
- defines what we expect
- calls the function to be tested to calculate actual result
- asserts that actual and expected results coincide

# Another function in test\_clean\_data.py

```
def test_clean_agreement_scale_known_missings():
    result = _clean_agreement_scale(pd.Series(["-77", "-99"]))
    expected = pd.Series([pd.NA, pd.NA], dtype=result.dtype)
    pd.testing.assert_series_equal(result, expected)
```

# Run pytest

```
hmg@hmg-home:~/econ/example
(epp) → example pytest -v
platform linux -- Python 3.11.0, pytest-7.4.2, pluggy-1.3.0 -- /mnt/miniforge/envs/e
pp/bin/python3.11
cachedir: .pytest cache
rootdir: /mnt/econ/example
plugins: anyio-4.0.0
collected 4 items
test_clean_data.py::test_clean_agreement_scale_check_dtype PASSED
test clean data.py::test clean agreement scale known missings PASSED
test clean data.py::test clean favorite language known missings PASSED
test clean data.py::test clean favorite language expected typos PASSED
(epp) → example
```

### **Basic rules**

- Put tests in modules called `test\_xxx.py`, with functions `test\_YYY\_zzz`, ...
  - `xxx` is the name of the module to be tested
  - 'yyy' is the name of the function to be tested
  - `zzz` is a description of the behaviour being tested
- Inside these functions, keep structure clear:
  - Define expected result
  - Calculate actual result
  - Assert that they coincide
- Usually one assert statement per test function
