#### **Effective Programming Practices for Economists**

## **Debugging**

#### Introduction to debugging

Janoś Gabler and Hans-Martin von Gaudecker

### What is debugging

- Debugging means fixing code that does not do what it should
- Two main situations
  - Your code does not run
  - Your code runs but you know the results are wrong
- Debugging is a skill that can be learned

# Why debugging is is important

- According to studies, programmers spend between 25 and 50 % of their time debugging
- There are huge differences in debugging efficiency of different programmers!
- We need to spend some effort to:
  - Avoid debugging
  - Be better at debugging

#### The two modes (Eisenstadt, 1993)

- **Inspeculation**, a hypbrid of:
  - "inspection" (code inspection),
  - "simulation" (hand-simulation),
  - and "speculation".
  - No experimentation, but "thinking about" the code.

#### Data gathering

- What we usually think of when talking about debugging
- What a debugger can make drastically more efficient
- Striking parallel to the scientific method
