Effective Programming Practices for Economists

Version Control and collaboration with Git and Github

Pre-commit hooks

Janoś Gabler and Hans-Martin von Gaudecker

What are pre-commit hooks

- We saw the importance of following style guides
- Pre-commit hooks are tools to help you automate style guides
- Examples of pre-commit hooks are:
 - The black formatter that automatically formats your code
 - The ruff linter that tells you about problems and fixes some of them
 - Line-ending fixers for better compatibility across platforms
- Save a lot of time but have a learning curve

Activating pre-commit hooks

- Install the pre_commit python package
 - conda install pre_commit
- Open a terminal in the root of your repository
- Execute pre-commit install

Just needs to be done once after cloning the repository

Configuring pre-commit hooks

```
repos:
    repo: https://github.com/psf/black
    rev: 23.9.1
    hooks:
        - id: black
        language_version: python3.11
```

- Pre-commit hooks are configured in .precommit-config.yaml
- Typically inherited from the project templates or copy it from another project
- Example shows just the black formatter

A useful git command

- git commit -am "Your message." stages and commits all modified files
- Does not work for untracked files
- Important because pre-commit hooks run over staged files!

A badly formatted python file

```
def clean_data(raw):
    df = pd.DataFrame(index=raw.index)
    df["coding_genius"]=clean_agreement_scale(raw['Q001'])
    df['learned_a_lot']=clean_agreement_scale(
      raw['0002'])
    df['favorite_language'] = clean_favorite_language(raw['Q003'])
    return df
def clean_agreement_scale(sr):
    sr = sr.replace(\{'-77': pd.NA, '-99':pd.NA\})
    categories = ['strongly disagree',
     'disagree',
'neutral', 'agree',
     'strongly agree'
    dtype = pd.CategoricalDtype(categories=categories,
    ordered=True)
    return sr.astype(dtype)
```

Git status

```
x _ ø 🖪 v
                                                                                                                          Q =
                                                              Terminal
                   Terminal
                                                            Terminal
                                                                                                      Terminal
example on 鵬main [+] via & v3.11.0 via @epp_topics
> git status
On branch main
Changes to be committed:
  (use "git restore --staged <file>..." to unstage)
    new file: example.py
example on 鵙main [+] via & v3.11.0 via Gepp_topics
>
```

First commit fails

```
- ø Fl v
                                                                                                                Q =
                                                         Terminal
                 Terminal
                                                       Terminal
                                                                                             Terminal
example on 鵬main [+] via 🐍 v3.11.0 via 😉 epp_topics
> git commit -am "Add example.py."
- hook id: black
- files were modified by this hook
reformatted example.py
All done! 🧩 🍰 🧎
1 file reformatted.
example on 鵬main [!+] via & v3.11.0 via @epp_topics
```

Second commit works

```
- ø F v
                                                Terminal
                                                                                                Q =
              Terminal
                                               Terminal
example on pmain [+] via & v3.11.0 via Gepp topics
> git commit -am "Add example.py."
black.....
hook id: black
- files were modified by this hook
reformatted example.py
All done! 🔆 🝰 🔆
1 file reformatted.
example on 鵬main [!+] via & v3.11.0 via @epp_topics
> git commit -am "Add example.py."
black.....
[main 4ee06b0] Add example.py.
1 file changed, 20 insertions(+)
create mode 100644 example.py
example on pmain via % v3.11.0 via Gepp topics
